# **AleFIT MAB Keeper**

## 802.1x Productivity tools can make your life easier!

#### **Product description**

The AleFIT MAB Keeper makes it possible to manage a number of settings of the Cisco ISE authentication system without direct access to its configuration interface. The application offers a simple and intuitive user interface and, by means of several modules, covers a variety of use cases thanks to which it is possible to solve problems which can typically occur after the 802.1x implementation due to missing or incompatible IT processes.

The application serves for the management of MAC addresses that are used in the system for authentication and not compatible with the 802.1x standard (printers, IP etc.) or for MAC address management for which a MAC address is used for authentication. This typically concerns consultant devices that for a certain time require access to the company network or employee BYOD. For such devices, an exception is created for access to the network thanks to the addition to the authentication system. For each exception, a variety of information is recorded that mitigates potential troubleshooting and decision-making regarding prolongation. There is also a possibility to block access to certain devices that could present a threat to the network.

A time limited exception can be made so that after the elapsing of a set time period, deletion from the application and authentication system is carried out automatically, without administrator intervention. There is a digital log of each operation the application performs automatically and of each instance of user activity through the application interface. It is possible to control access to the application on the basis of user-defined roles by means of membership in groups of the Active Directory.

### Main advantages of application implementation:

- the option for setting exceptions for time-limited access to the network and allowing automatic application deletion
- · limiting access to the application based on user-defined roles
- · customization of the application and user interface for specific customer needs
- auditing of all application operations that can simplify troubleshooting and security auditing

# **AleFIT Office Locator**

# 802.1x Productivity tools can make your life easier!

### **Product description**

The AleFIT Office Locator application is a help desk portal that monitors and analyzes 802.1x authentication and provides authorized users with information from various sources needed for determining the causes of problems with authentication and resolving incidents in a simple web interface.

The application registers individual authentication sessions and presents their statuses along with additional information from the Cisco ISE system, the Active Directory and the network switches. Operator thus has the option, for example, to oversee user accounts in the Active Directory and the configuration port on switches without having to access these systems directly. The availability of the various functionalities is managed through user membership in the groups of the Active Directory.

Part of the application is the interface for the management of switches on whose ports the monitoring of events is just being carried out. The application provides the opportunity to cut the costs of authentication system administration and moreover to shorten the time for which a user experiencing authentication problems is unable to connect to the network and get to work.

### Main advantages of application implementation:

- screening of users from the configuration interface of the Cisco ISE system, network switches and the Active Directory
- · availability of information from various sources required for troubleshooting and problem-solving
- saving of information in the database also after the deletion from the Cisco ISE system
- option for customization of the application as well as the user interface according to specific customer needs
